SUMMARY

Final-year B.Tech CS student (minor: Health Informatics & AI/ML) with 3 deployed, user-tested applications covering full-stack web development, REST API design, and cloud deployment. Completed a software engineering internship shipping features across agile sprints in a cross-functional team. Picks up new frameworks and tools quickly, comfortable working across the stack, and able to explain technical decisions clearly to both technical and non-technical audiences. Open to relocating across project locations.

EDUCATION

VIT Bhopal University

B.Tech – Computer Science (Minor: Health Informatics & AI/ML); GPA: **8.55 / 10**

DPS Durg

Class XII CBSE: **94%** | Class X CBSE: **91%**

Bhopal, India

2022 – 2026

Chhattisgarh, India

2018 – 2020

TECHNICAL SKILLS

Languages: Python, JavaScript (ES6+), TypeScript, SQL, Bash

Web Frameworks: React.js, Node.js, Express.js, Flask, FastAPI, Next.js

Databases: MySQL, MongoDB, PostgreSQL

AI & ML: Scikit-learn, TF-IDF, Cosine Similarity, LLM API Integration (Groq LLaMA 3.1, Gemini 1.5 Flash), NLP, Pandas

Cloud & DevOps: AWS (EC2, S3, ECS, IAM), Docker, Docker Compose, GitHub Actions CI/CD, Vercel, Render

Auth & Security: JWT, Google OAuth 2.0, bcrypt, Fernet AES-128, CSRF Protection, Rate Limiting

Core CS: Data Structures & Algorithms, OOP, DBMS, Operating Systems, Computer Networks

Tools: Git, GitHub, Postman, Figma, Agile/Scrum, Code Reviews, Responsive/Mobile-First Design

EXPERIENCE

Software Engineering Intern | Ethnus

Jan 2025 – May 2025

- Delivered 4 production frontend modules — authentication, real-time messaging, document sharing, and RBAC access control — in React.js and Tailwind CSS across 3 agile sprints on a live platform with 15+ active users.
- Enforced admin and employee permission hierarchies through conditional rendering and protected route logic across 8 API endpoints; contributed to backend middleware configuration in a 4-person cross-functional team.
- Integrated WebSocket-based real-time whiteboard and live messaging, enabling synchronous collaborative editing for up to 6 concurrent users with no regressions on existing features.
- Provisioned AWS EC2 instances with security group rules, network isolation, and IAM policies; wrote Bash scripts for environment setup, deployment health checks, and log aggregation.
- Participated in peer code reviews each sprint, surfacing UI inconsistencies and component logic gaps before release; submitted and reviewed ~4 pull requests per sprint.

PROJECTS

SkillRadar | Python, Flask, Scikit-learn, TF-IDF, Groq LLaMA 3.1, Docker | [GitHub](#) | [Live](#)

Feb 2026 – Mar 2026

- Built an NLP pipeline using TF-IDF vectorisation and cosine similarity to score resume-JD alignment, returning a percentage match with matched and missing skills surfaced separately from general keyword results.
- Cross-referenced a 200+ tech-skills dictionary against both documents to produce specific, actionable skill-gap output rather than a raw overlap score.
- Called Groq LLaMA 3.1 API with missing-skill context to return 3–5 targeted improvement suggestions per scan; added a rule-based strength scorer assessing section completeness, action verb usage, and quantification.
- Containerised the full application with Docker and exposed all functionality through a clean REST API.

CareCrypt | Python, Flask, MySQL, Fernet AES-128, Groq LLaMA 3.1 | [GitHub](#) | [Live](#)

Jan 2026 – Feb 2026

- Designed a REST API backend across 13 endpoints and 5 normalised MySQL tables; stored sensitive patient fields as AES-128 encrypted BLOBs so plaintext never persists to disk or in transit.
- Integrated Groq LLaMA 3.1 to generate plain-English prescription summaries on demand, with every AI call logged to an audit trail recording user ID, IP address, and timestamp — making output traceable for non-technical users.
- Combined Flask-Limiter rate controls (5 req/min), bcrypt hashing, CSRF-protected forms, parameterised queries, and time-limited reset tokens to reduce common attack surfaces.
- Containerised with Docker Compose and deployed to Render; sustained sub-200ms response times on a query-optimised schema across 10 beta users.

Streakify | React.js, Node.js, Express.js, MongoDB, JWT, Vercel + Render | [GitHub](#) | [Live](#)

Aug 2025 – Oct 2025

- Built a mobile-first habit tracker across 6 responsive views; cross-device tested with 10 real users each managing 6–7 habits, resolving layout and interaction bugs found during testing.
- Designed a date-driven streak algorithm across 3 normalised MongoDB collections handling continuity tracking, missed-day resets, and multi-habit management across daily, weekly, and monthly recurrence models.
- Rendered a GitHub-style contribution heatmap and analytics charts from scratch in React without third-party libraries, using lazy loading and code splitting for fast initial load.

- Secured all API endpoints with JWT authentication and bcrypt hashing, with server-side validation on every authenticated route.

NutriGenie | *Python, FastAPI, Scikit-learn, MongoDB, Streamlit, Hugging Face* | [GitHub](#) | [Live](#) Dec 2024 – Feb 2025

- Built a FastAPI backend running a KNN and cosine similarity model over 522K+ recipes, returning ranked meal plans as structured JSON within 300ms average response time.
- Designed a 6-parameter user profiling pipeline computing BMI, BMR, and caloric targets across 4 weight plans with adjustable top-N (5–20) recommendations per request.
- Separated the Streamlit frontend and FastAPI backend into independently deployable services; packaged with Docker and hosted on Hugging Face Spaces with MongoDB for low-latency retrieval.
